

Anthony Nnanna

Full Stack Software Developer

anthonymnannac@gmail.com | github.com/chiefJurist | linkedin.com/in/anthony-nnanna-966663392

Remote (Timezone: GMT +1)

PROFESSIONAL SUMMARY

Full Stack Software Developer with 5 years of experience building, scaling and optimizing web applications using Node.js, PHP, Laravel, React, Vue and Python. Experienced in API development, database optimization, DevOps automation and delivering high-impact features that improve application performance and business outcomes.

TECHNICAL SKILLS

Backend: PHP, Laravel, Node.js, TypeScript, Python, Microservices,DDD, EDA, REST API, WebSockets, OAuth.

Frontend: Vue.js, React, Next.js, Nuxt, JavaScript, Tailwind CSS, State Management, Performance Optimization.

Database & Caching: MySQL, PostgreSQL, MongoDB, SQLite, Redis, Query & Index Optimization.

DevOps & Cloud: GCP, Docker, CI/CD, Kubernetes, Git, GitHub Actions, Linux CLI, Nginx, Apache.

Testing & Observability: PHPUnit, Pest, Playwright, Vitest, Postman, Datadog, Prometheus, ELK, Sentry, Grafana.

Methodologies: Agile, Test-Driven Development, SOLID principles, Architectural Design Patterns, Code Review.

PROFESSIONAL EXPERIENCE

FullStack Software Developer · Sourcedware · January 2022 - Present, Remote.

- Architected and deployed 11 full-stack production web applications using Node.js, PHP, Laravel, TypeScript, Vue.js, Next.js, React.js, Nuxt, Wordpress and Python for cross-continental clients (Europe / America), maintaining 100% on-time delivery.
- Optimized APIs, reducing response times by 40% and database load by 50% through MySQL/PostgreSQL query optimization and Redis caching strategies.
- Implemented CI/CD pipelines with GitHub Actions reducing deployment time from over 45 minutes to 8 minutes, enabling rapid iteration and faster releases.
- Engineered asynchronous background processing systems using Redis queues and MongoDB, ensuring zero data loss across 4 high-traffic production apps.
- Integrated third-party microservices including Stripe for payments and Firebase for authentication.

Full Stack Developer Intern · Sourcedware · July 2021 - December 2021, Remote.

- Collaborated closely with product managers, non-technical stakeholders and designers to translate business requirements into technical blueprints and clean code.
- Developed responsive frontend interfaces using Tailwind CSS and Vue.js/React, ensuring seamless cross-browser compatibility and user experiences.
- Maintained and updated client content management systems using WordPress and PHP while writing comprehensive documentation for technical handoffs.
- Conducted rigorous manual and automated API testing using Postman to identify and resolve edge-case vulnerabilities prior to production releases.

PROJECTS

Limit-Order Exchange Engine - [github.com/chiefJurist/cryptocurrency-exchange-engine]

Tech Stack: Laravel, Vue.js 3, MySQL, Redis, Pusher

- Designed and stress-tested a real-time cryptocurrency trading engine against billions of simulated orders using Laravel factories and seeders.
- Achieved sub-100ms matching latency while using Redis queues for asynchronous order processing.
- Implemented atomic transaction logic preventing race conditions with zero financial discrepancies across billions of simulated trades.
- Developed price-matching algorithm with automatic 1.5% commission calculation for both buy and sell orders.
- Integrated Pusher for real-time order-match events with instant UI updates to both trading parties.

Jars Of Glory NGO - [jarsofglory.org]

Tech Stack: Vue.js, TypeScript, Tailwind

- Built a headless WordPress platform with Vue.js and TypeScript frontend enabling non-technical content management for the NGO based in Melbourne, Florida.
- Implemented a Stripe donation system that processed over 500 transactions, contributing to more than \$120K raised and a 65% increase in online giving.
- Developed event registration platform managing over 21 charity events and reducing coordination time by 70%.
- Maintained platform availability while delivering over 30 production updates without service disruption.

Mercatura - [github.com/chiefJurist/mercatura] / [pypi.org/project/mercatura]

Tech Stack: Python, CCXT, TA-Lib, asyncio, WebSockets

- Built a real-time data pipeline streaming Binance liquidation events across 100+ markets via WebSockets.
- Designed configurable signal-detection logic using rolling time-window aggregation of liquidation data.
- Developed a testing feature to see how configured signals would have performed in previous weeks.
- Published as an installable PyPI package with pytest coverage and CI via GitHub Actions.

EDUCATION

B.Sc. Computer Science · Federal University of Technology Owerri · Sept 2020 - July 2025

ADDITIONAL INFORMATION

Languages: English (fluent).
